

It's All About Being Prepared !

Improving Staff's Initial Code Response on
an Acute Care Unit

Tana Hall RN,BSN,PCCN

Code Blue

Background

- ▶ It was identified that many inpatient acute care units experienced challenges with initial code response.
- ▶ We conducted a survey in January of 2019 on an acute care unit regarding perception of the unit's code response (prior to code team arrival)

Background

- ▶ In the survey, less than 60% of RN's felt the staff was organized in quickly defining roles, confident that all the roles would be assumed, and found ease and minimal anxiety in assuming a role.
- ▶ This indicated a opportunity for improvement.

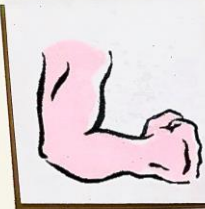

Code Responder Roles

Assigning Code Responder Roles

CHARGE
Ron

BUDDIES
John - Alexis
Kam; - Shari
Helen - Anna

Improvements in all Elements of Survey

- 84% Staff felt the nursing team was organized in quickly defining Roles.
- 67% Reported confidence that all the roles would be assumed
- 47% Staff reported minimal anxiety in assuming a role.
- 75% Reported ease in assuming a role.

Conclusion

- ▶ Developing processes that help create organization and clarify role responsibilities prior to a code response is an replicable, cost neutral intervention that can greatly improve both individual and unit performance in initial code response.

Acknowledgements

- ▶ I would like to thank my unit educator Andrea Bottorff, for her help writing the proposal and setting up the survey. It would not have been done without her guidance.
- ▶ I would also like to thank my unit manager Kim Smith for her support of the project.
- ▶ Any questions contact me halta@ohsu.edu
